In the context of the present specification, the term "therapy" also includes "prophylaxis" unless there are specific indications to the contrary. The terms "therapeutic" and "therapeutically" should be construed accordingly.

Prophylaxis is expected to be particularly relevant to the treatment of persons who
10 have suffered a previous episode of, or are otherwise considered to be at increased risk of, the disease or condition in question. Persons at risk of developing a particular disease or condition generally include those having a family history of the disease or condition, or those who have been identified by genetic testing or screening to be particularly susceptible to developing the disease or condition.

In another aspect the present invention provides the use of a pharmaceutical
15 combination as hereinbefore defined in the manufacture of a medicament for the modulation of the CCR3 chemokine receptor and histamine antagonism, leukotriene modulation, beta-agonism, phosphodiesterase inhibition or the administration of a steroid, human cytokine or an antibody is beneficial. In a further aspect such medicament is for the
20 treatment of asthma or rhinitis.

The invention also provides a method of treating asthma or rhinitis in a person suffering from, or at risk of, said disease, which comprises administering to the person a therapeutically effective amount of a pharmaceutical combination as hereinbefore defined.

For the above-mentioned therapeutic uses the dosage administered will, of course,
25 vary with the compound employed, the mode of administration, the treatment desired and the disorder indicated.

The compound of formula (I) and the histamine antagonist, steroid, leukotriene modulator, human cytokine, beta-agonist, phosphodiesterase inhibitor or antibody may be comprised in the same or separate formulations. When in separate formulations, the
30 compound of formula (I) may be administered before, at or about the same time as or after the histamine antagonist, steroid, leukotriene modulator, human cytokine, beta-agonist, phosphodiesterase inhibitor or antibody.

In one further aspect of the invention the compound of formula (I) is administered at or about the same time as the histamine antagonist, steroid, leukotriene modulator, human cytokine, beta-agonist, phosphodiesterase inhibitor or antibody. Especially, the compound of formula (I) and the histamine antagonist, steroid, leukotriene modulator, human cytokine, beta-agonist, phosphodiesterase inhibitor or antibody. Further, said formulation is designed for oral administration.

Depending on the mode of administration, the pharmaceutical composition will preferably comprise from 0.05 to 99%w (per cent by weight), more preferably from 0.05 to 80%w, still more preferably from 0.10 to 70%w, and even more preferably from 0.10 to 50%w, of active ingredients, all percentages by weight being based on total composition.

The pharmaceutical composition may be administered topically (for example to the lung and/or airways or to the skin) in the form of a solution, suspension, heptafluoroalkane aerosol or dry powder formulation; or systemically, for example by oral administration in the form of a tablet, capsule, syrup, powder, aerosol or granule, or by parenteral administration in the form of a solution or suspension, or by subcutaneous administration or by rectal administration in the form of a suppository or transdermally.

EXAMPLE A

Preparation of 1-(3,4-dichlorobenzyl)-4-piperidinamine, di-trifluoroacetate salt
Step i: tert-butyl 1-(3,4-dichlorobenzyl)-4-piperidinylcarbamate

Sodium triacetoxyborohydride (6g) was added to a stirred solution of 3,4-dichlorobenzaldehyde (4.2g) and 1,1-dimethylethyl-4-piperidinyl carbamate (4g) in dichloromethane (50ml). The mixture was stirred at room temperature for 4h then partitioned between ethyl acetate and aqueous sodium hydrogencarbonate. The organic layer was washed with water, dried and evaporated under reduced pressure. The residue was triturated with ether to give a white solid (3.5g) which was used directly in step ii.

Step ii: 1-(3,4-Dichlorobenzyl)-4-piperidinamine, di-trifluoroacetate salt

The product from step (i) (3.5g) was treated with trifluoroacetic acid (10ml) in dichloromethane (40ml). After 72h, the solution was evaporated, the residue triturated with ether and the solid (4.3g) collected.
